Hiring Team
TeamViewer

Re: Senior Azure DevOps & Platform Engineer

Dear Hiring Team,

I am applying for the Azure DevOps and Platform Engineering opportunity at TeamViewer. With 10+ years of experience in cloud infrastructure, SaaS delivery, and production operations, I bring hands-on Azure platform engineering, Kubernetes, Infrastructure as Code, and delivery automation experience. The opportunity to help operate the secure, scalable infrastructure behind TeamViewer's global SaaS platform closely matches my technical strengths and interest in reliable cloud-native systems.

My experience includes building Azure infrastructure with Terraform and Bicep and operating AKS platforms with Docker, Helm, and Argo CD. I use GitOps to make application configuration and deployment changes reviewable and repeatable, with controlled reconciliation, health validation, and recovery procedures. I also build reusable Azure DevOps pipelines that connect container builds, automated tests, vulnerability scanning, infrastructure validation, and gated deployment.

Reliability is a core part of my platform work. I use Azure Monitor, Log Analytics, Application Insights, Prometheus, and Grafana to diagnose service failures and identify capacity constraints. My responsibilities include on-call support, incident response, root cause analysis, and operational runbooks. I review pod resources, autoscaling settings, and cloud utilization to improve performance and availability while controlling cost.

I develop Python, Bash, and PowerShell tooling to automate deployment checks and recurring operational tasks. My experience also spans cloud networking, Entra ID, managed identities, Key Vault, Kubernetes security controls, and relational database dependencies. Alongside Azure, I bring AWS platform experience with EKS/ECS, Terraform/CloudFormation, CloudWatch, and managed application services, supporting consistent delivery and operational practices across environments.

I enjoy mentoring engineers and working with Engineering, Product, Security, and Platform teams to turn operational lessons into better standards and developer workflows. As a Microsoft Certified Azure DevOps Engineer Expert, I would welcome the opportunity to contribute to TeamViewer's platform reliability, GitOps practices, and automation capabilities. Thank you for considering my application. I look forward to discussing how my experience can support your team.

Sincerely,
Rajendra P N
