Re: Lead DevOps Engineer

Dear Hiring Manager,

I am excited to apply for the Lead DevOps Engineer role. With 10+ years of experience in build automation, release engineering, and production delivery, I bring a strong combination of Azure DevOps engineering, Android/iOS release automation, and embedded software build and release support. The opportunity to connect these disciplines in a medical-product environment particularly interests me: reliable delivery, clear release evidence, and careful verification have a direct bearing on the quality of the product people depend on.

In my current role at AT&T, I engineer reusable, multi-stage Azure Pipelines covering builds, tests, packaging, and deployments. My work includes Azure Repos branch policies, versioned artifacts, environment configuration, approval gates, and secure pipeline access through Azure Key Vault. I also develop Python and PowerShell utilities to simplify release preparation and troubleshooting. This experience aligns closely with your need for a hands-on lead who can improve delivery practices and take work from an initial requirement through verified completion.

Mobile delivery is another close match. Across my recent roles at AT&T, GlobalLogic, and Akamai, I have supported Bitrise workflows for Android and iOS builds and releases. My experience covers Gradle builds, APK/AAB packaging, signing inputs, Xcode archives, provisioning profiles, TestFlight distribution, and Google Play and App Store publishing activities. I also bring embedded build and release experience involving versioned binaries, toolchain configuration, checksums, and release manifests, helping teams maintain traceability across delivered software components.

I approach release quality through automated tests, static analysis, security checks, review controls, and documented verification. When issues arise, I use build logs, Azure Monitor, and Log Analytics to investigate causes and coordinate fixes with development and QA. I would bring that discipline to your IEC 62304 Class C environment, working closely with quality, regulatory, cybersecurity, and product teams to follow established procedures. I use AI-assisted scripting and documentation selectively, with engineering review, test validation, and care for sensitive information.

I would welcome the opportunity to discuss how my Azure and mobile delivery background can help your team launch dependable products and improve the engineering experience. Thank you for considering my application.

Sincerely,

Rajendra P N
